

# X8's "L" Type Receiver Antenna Install Manul

The X8's "L" Type Receiver has two long with coaxial cable antennas. To obtain the best results of the diversity function, please refer to the following instructions;

1. The naked tail wire is a real 2.4G antenna. This two antennas must be kept as straight as possible, don't cut short or broken it, otherwise there will reduce the effective range.
  2. The two antennas should be take apart from each other as the picture shows.
- This is not a critical figure, but the most important thing is to keep the antennas away from each other as much as possible.
3. The antennas must be kept away from conductive materials, such as metal and carbon by at least a half inch.
  4. The coaxial part of the antennas does not need to follow these guidelines, but do not bend it in a small radius.
  5. Keep the antennas away from the motor, ESC, and other EMC noise sources as much as possible
